2. `char *buffer = malloc(size); scanf("%s", buffer);` /* read the line from command line */ Then your `timefunc` returns a value from this function: `double timefunc(double starttime, double endtime, const int length) {` And you can do something to calculate time remaining to read lines from the file. Both of the above change the meaning of your `timefunc` however if you really want the computation of time you should need to have a different function. Now about the question regarding C++ it is another story. I'm not sure that there is something like `scanf` in C++. What is the equivalent I have to use? I have to read the same line from file to different strings or `char**` that I have to use to do a calculation? Use `stringstream`. If you are a C++ person, the definition of the `timefunc` is also much more easy. If you just want to display the time passed in seconds you can do: `void timefunc() { double endtime = (double)clock() + 60; //doubles are percents double starttime = (double)clock(); time_t endtime_sec = starttime; time_t endtime_usec = starttime; double time_in_sec = (endtime_sec - starttime_sec); double time_in_usec = (endtime_usec - starttime_usec); std::cout`
